Seed Consultants, Inc	Seed Consultants	P.O. Box 370, Washington Courthouse, OH 43160
Southern States Cooperative, Inc	Southern States	6606 West Broad St., Richmond, VA 23230
Syngenta	Garst and NK Brand	11055 Wayzata Blvd., Minnetonka, MN 55305
T.A. Seeds	T.A. Seeds	PO Box 300, Avis, PA 17721

NARRATIVE

This report contains the results for performance trials from commercial corn hybrids produced for silage at four locations in Virginia in 2012 as well as two and three year average performance, when available. In order to avoid problems with comparisons over sites and years, multi-year yields are presented as a percentage of the total at that particular site-year combination called relative yield. All locations were planted with a Wintersteiger PlotKing 2600 planter and harvested with commercial silage equipment. Yields are presented on a dry matter and 35% dry matter basis for comparison. All hybrids entered in the Virginia trials were submitted for testing by commercial companies. The locations at which particular hybrids were entered were specified by the company. Companies entering hybrids were charged a fee for each hybrid per location to support the Virginia Corn Silage Performance Trials.

Yield Differences

Experimental plots vary in yield and other measurements due to location in the field and other factors which cannot be controlled. Statistics given in the tables are intended to help the reader make valid comparisons between hybrids. The magnitude of differences due to uncontrollable variation has been computed for the data and listed at the bottom of columns as the LSD (.10) (least significant difference with 90% confidence). Differences less than the LSD are assumed not to be real differences with 90% confidence.

Hybrid Choices

Multi-year results are more reliable than single-year results.

When making hybrid selections it is important to realize that hybrids differ in their performance under different environments. Some hybrids are more adapted to a wide range of environments. Hybrid performance may differ with year and location variations of rainfall, temperature, pests and other environmental variables. In these experiments, many hybrids have essentially the same yield, and great care should be taken in interpreting the results of a single year's tests, especially at only one location. For these reasons it is important, whenever possible, to also look at a hybrid's average yield across locations when making selections. Multi-year averages give greater confidence to hybrid performance decisions. Relative yield tables compare the yield of a hybrid to the average yield of all hybrids in the test. These tables are an excellent summary of yield potential compared to other hybrids.

Understanding Relative Yield

Companies entering silage hybrids decide which hybrids are planted at which locations. In 2012, some hybrids were planted at all four locations and others at only one or two sites.

Combining and comparing absolute yield and other results from multiple sites is inappropriate when not all hybrids are planted at all locations. For example, one hybrid might have an unfair advantage in such a comparison because it was tested only at sites with ideal growing conditions. Another hybrid tested at sites with less-than-ideal growing conditions would have yields that tended to be lower. In this example, it would be difficult to determine whether yield differences were because of differences in genetic yield potential or simply because of differences in the environmental conditions under which they were tested. The solution is to compare hybrids based on relative yields rather than absolute yields.

To calculate relative yield, the yield for each hybrid at each site is divided by the average yield for all hybrids tested at that same site and multiplied by 100. Once each hybrid at each site has been assigned a relative yield, comparisons can be made between hybrids tested at the same site or different sites. For hybrids tested at multiple sites, we can also calculate a multi-site relative yield average.

Relative yields of 100 indicate hybrids that were average performers. Relative yields greater than 100 indicate yields above-average. Relative yields less than 100 indicate yields below-average. The magnitude of the relative yield numbers indicate how far above or below average a hybrid performed. For example, a hybrid with a relative yield of 110 yielded 10% above the average yield for all hybrids at that site.

Selecting hybrids for both yield and quality.

Milk2006 is used to condense multiple corn silage quality and digestibility factors into one easy-to-compare "milk per ton" number. This system also generates a "milk per acre" rating for each hybrid, calculated by multiplying yield (tons per acre) by quality (lbs of milk per ton). The same problem described above for multi-site yield comparisons exists for yield by quality comparisons: not all hybrids were tested at all sites. Therefore, relative quality and relative yield x quality ratings were calculated.

Milk2006 is a system developed by University of Wisconsin researchers to simplify quality comparisons between corn silage samples. Included in the analysis are variety identification, kernel processing, dry matter, crude protein, NDF, in-vitro NDF digestibility, starch percent and yield per acre. Compared to

Milk2000, Milk2006 values more accurately address the effects of fiber digestibility on silage quality. Milk2006 has proven to more accurately reflect actual milk production than earlier versions of the program. Values presented in previous years using Milk2000 have been recalculated using Milk2006 in this publication for the purpose of over-years comparisons.

Milk2006 was designed solely as an index to be used when making quality comparisons between silage samples or hybrids. Milk per ton or milk per acre numbers should not be used to predict actual milk production on your farm. Milk per ton is more accurate at predicting cow performance since it includes quality factors that affect milk production. Milk per acre allows consideration of yield as well as quality factors.

Use other information.

Consider as much other information as possible from other independent sources before selecting hybrids. Look for agronomic as well as silage quality data.

2012 VIRGINIA CORN SILAGE PLOT INFORMATION
(Rates are on a per acre basis.)

Blackstone Southern Piedmont Agricultural Research & Extension Center (notill site)

Planted: April 10, 2012

Harvested: July 16-17, 2012

Pesticide: 5 lb Force 3G® at planting

Fertilizer: 1000 lb 10-10-10 preplant incorporated April 9, 2012; 17 gal 20-10-0-2.2S-.13B-.25Zn at planting; 80 lb N topdressed using UAN 32 May 15, 2012.

Plot Size: 2 rows 25' x 30" 4 replications

Soil Type: Spotsylvania-Cecil-Bourne Sandy Loam

Cooperator: Ned Jones

Orange Northern Piedmont Agricultural Research & Extension Center

Planted: May 22, 2012

Harvested: August 21, 2012

Pesticide: 5 lb Force 3G® at planting; 3 qt Lumax® + 1 qt atrazine + 1 qt glyphosate April 17, 2012; 1 qt Gramoxone May 1, 2012; spot-sprayed grass areas with 1 qt glyphosate May 21, 2012; 1 oz Impact®.

Fertilizer: 30-80-60 preplant incorporated April 20, 2012; 17 gal 20-10-0-2.2S-.13B-.25Zn at planting; 100 lb N sidedressed June 19, 2012.

Plot Size: 2 rows 25' x 30" 4 replications

Soil Type: Davidson silty clay loam

Cooperators: Steve Gulick and Alvin Hood

Shenandoah Valley (Lynnwood - Thanks to Monte and Gerald Heatwole at Cub Run Dairy)

Planted: May 21, 2012

Harvested: September 12, 2012

Pesticide: 5 lb Force 3G® at planting; 1.125 qt Aatrex® (atrazine) + 1.5 qt Princep® + 5.8 oz Asana® + 1.5 qt Lumax® May 12, 2012; 1.5 qt Prowl® + 0.5 oz Profine (generic Permit) + 1.25 qt Touchdown Total® (glyphosate).

Fertilizer: Preplant broadcast 8 tons dairy heifer bed; 17 gal 20-10-0-2.2S-.127B-.25Zn at planting; 20 lb S as AMS + chemicals May 12, 2012.

Plot Size: 2 rows 35' x 30" 4 replications

Soil Type: Allegheny fine sandy loam

Cooperators: Matt Yancey and Monte Heatwole

Washington County (Thanks to Johnny Robinson)

Planted: June 17, 2012

Harvested: September 13, 2012

Pesticide: 5 lb Force 3G® at planting; Roundup® plus 2 qt Bicep Magnum®; spot treatment with Accent® for johnsongrass.

Fertilizer: 81-41-180 preplant; 17 gal 20-10-0-2.2S-.127B-.25Zn at planting; 100 lb N sidedressed.

Plot Size: 2 rows 35' x 30" 4 replications

Soil Type: Wyrick-Marbie

Cooperators: Phil Blevins and Johnny Robinson

¹ Days to maturity provided by company; differences in maturity rating methods may exist between companies.

² Hybrids that were tested over more site/year combinations provide a better estimate of hybrid performance than those tested only in a single site/year location.

³ Relative Ton per Acre (yield) calculated by dividing Ton per Acre for each hybrid at each site/year by the average Ton per Acre for that site/year. Numbers over 100 indicate above-average yield, 100 indicates average yield, numbers under 100 indicate below-average yield.

* Indicates numbers not significantly different from the highest value in that column (i.e. within one LSD of the top performer.)

Shading indicates hybrids that were in the highest yielding group in at least three site years.

¹ Days to maturity provided by company; differences in maturity rating methods may exist between companies.

² Hybrids that were tested over more site/year combinations provide a better estimate of hybrid performance than those tested only in a single site/year location.

³ Relative Milk per Acre (yield x quality) calculated by dividing Milk per Acre for each hybrid at each site/year by the average Milk per Acre for that site/year.

Numbers over 100 indicate above-average yield, 100 indicates average yield, numbers under 100 indicate below-average yield.

* Indicates numbers not significantly different from the highest value in that column (i.e. within one LSD of the top performer.)

Shading indicates hybrids that were in the highest yielding group in at least three site years.
