| T.A. Seeds | T.A. Seeds | 39 Seeds Lane, Jersey Shore, PA 17740 |

NARRATIVE

This report contains the results for performance trials from commercial corn hybrids produced for silage at four locations in Virginia in 2015 as well as two and three year average performance, when available. In order to avoid problems with comparisons over sites and years, multi-year yields are presented as a percentage of the total called relative yield at that particular site-year combination. All locations were planted with a Wintersteiger PlotKing 2600 planter and harvested with commercial silage equipment. Yields are presented on a dry matter and 35% dry matter basis for comparison. Quality analysis was performed using a Foss NIR XDS Rapid Content Analyzer. All hybrids entered in the Virginia trials were submitted for testing by commercial companies. The locations at which particular hybrids were entered were specified by the company. Companies entering hybrids were charged a fee for each hybrid per location to support the Virginia Corn Silage Performance Trials.

Yield Differences

Experimental plots vary in yield and other measurements due to location in the field and other factors which cannot be controlled. Statistics given in the tables are intended to help the reader make valid comparisons between hybrids. The magnitude of difference due to uncontrollable variation has been computed for the data and is listed at the bottom of columns as the LSD (.10)

(least significant difference with 90% confidence). Differences less than the LSD are assumed not to be real differences with 90% confidence.

Hybrid Choices

Multi-year results are more reliable than single-year results.

When making hybrid selections it is important to realize that hybrids differ in their performance under differing environments. Some hybrids are more adapted to a wide range of environments. Hybrid performance may differ with year and location variations of rainfall, temperature, pests and other environmental variables. In these experiments, many hybrids have essentially the same yield, and great care should be taken in interpreting the results of a single year's tests, especially at only one location.

For these reasons it is important, whenever possible, to also look at a hybrid's average yield across locations when making selections. Multi-year averages give greater confidence to hybrid performance decisions. Relative yield tables compare the yield of a hybrid to the average yield of all hybrids in the test. These tables are an excellent summary of yield potential compared to other hybrids.

Understanding Relative Yield

Companies entering silage hybrids decide which hybrids are planted at which locations. In 2015, some hybrids were planted at all four locations and others at only one or two sites.

Combining and comparing absolute yield and other results from multiple sites is inappropriate when not all hybrids are planted at all locations. For example, one hybrid might have an unfair advantage in such a comparison because it was tested only at sites with ideal growing conditions. Another hybrid tested at sites with less-than-ideal growing conditions would have yields that tended to be lower. In this example, it would be difficult to determine whether yield differences were because of differences in genetic yield potential or simply because of differences in the environmental conditions under which they were tested. The solution is to compare hybrids based on relative yields rather than absolute yields.

To calculate relative yield, the yield for each hybrid at each site is divided by the average yield for all hybrids tested at that same site and multiplied by 100. Once each hybrid at each site has been assigned a relative yield, comparisons can be made between hybrids tested at the same site or different sites. For hybrids tested at multiple sites, we can also calculate a multi-site relative yield average.

Relative yields of 100 indicate hybrids that were average performers. Relative yields greater than 100 indicate yields above-average. Relative yields less than 100 indicate yields below-average. The magnitude of the relative yield numbers indicate how far above or below average a hybrid performed. For example, a hybrid with a relative yield of 110 yielded 10% above the average yield for all hybrids at that site.

Selecting hybrids for both yield and quality.

Milk2006 is used to condense multiple corn silage quality and digestibility factors into one easy-to-compare "milk per ton" number. This system also generates a "milk per acre" rating for each hybrid,

calculated by multiplying yield (tons per acre) by quality (pounds of milk per ton). The same problem described above for multi-site yield comparisons exists for yield by quality comparisons: not all hybrids were tested at all sites. Therefore, relative quality and relative yield x quality ratings were calculated.

Milk2006 is a system developed by University of Wisconsin researchers to simplify quality comparisons between corn silage samples. Included in the analysis are variety identification, kernel processing, dry matter, crude protein, NDF, in-vitro NDF digestibility, starch percent and yield per acre. Compared to Milk2000, Milk2006 values more accurately address the effects of fiber digestibility on silage quality. Milk2006 has proven to more accurately reflect actual milk production than earlier versions of the program.

Milk2006 was designed solely as an index to be used when making quality comparisons between silage samples or hybrids. Milk per ton or milk per acre numbers should not be used to predict actual milk production on your farm. Milk per ton is more accurate at predicting cow performance since it includes quality factors that affect milk production. Milk per acre allows consideration of yield as well as quality factors.

Use other information.

Consider as much other information as possible from other independent sources before selecting hybrids. Look for agronomic as well as silage quality data.

2015 VIRGINIA CORN SILAGE PLOT INFORMATION
(Rates are on a per acre basis.)

Blackstone Southern Piedmont Agricultural Research & Extension Center

Planted: April 17, 2015 no-till into soybean stubble

Harvested: August 12, 2015

Pesticide: 5 lb Force 3G® at planting; 2 qt Roundup® + 4 qt Lexar® April 17, 2015

Fertilizer: 1000 lb 10-10-10 preplant incorporated April 16, 2015; 17 gal 20-10-0-2.2S-.13B-.25Zn at planting; 80 lb N top-dressed using UAN May 19, 2015

Plot Size: 2 rows 25' x 30" 4 replications

Soil Type: Sandy loam

Cooperator: Ned Jones

Orange Northern Piedmont Agricultural Research & Extension Center

Planted: April 28, 2015 no-till into soybean stubble

Harvested: August 13, 2015

Pesticide: 5 lb Force 3G® at planting; 1 pt Atrazine 4L + 2 qt Gramaxone® + 3.5 qt Lexar EZ April 24, 2015

Fertilizer: 30-80-60 April 24, 2015; 17 gal 20-10-0-2.2S-.13B-.25Zn at planting; 100 lb N side-dressed June 1, 2015

Plot Size: 2 rows 25' x 30" 4 replications

Soil Type: Starr

Cooperators: Steve Gulick

Shenandoah Valley (Timberville - Thanks to Windcrest Dairy)

Planted: May 13, 2015 No-till into rye chop stubble

Harvested: September 1, 2015

Pesticide: 5 lb Force 3G® at planting; 1.0 lb Atrazine DF + 1 qt glyphosate + 4.5 oz Corvus + 5 oz 2,4-D ester pre-plant; 0.3 oz Accent® Q post-emergence

Fertilizer: Preplant broadcast 6000 gal dairy slurry; 17 gal 20-10-0-2.2S-.127B-.25Zn at planting

Plot Size: 2 rows 35' x 30" 4 replications

Soil Type: Edom silty clay loam

Cooperators: Jeremy Daubert, Doug Horn and David Yutzy

Washington County (Thanks to Johnny Robinson)

Planted: May 11, 2015

Harvested: September 18, 2015

Pesticide: 5 lb Force 3G® at planting; 30 oz glyphosate + 3 qt Lumax® plus 1 qt atrazine post planting; 8 oz Yukon (halosulfuron + dicamba) post-emergence

Fertilizer: 100-40-40 preplant on May 7, 2015; 90 lb N side-dressed at V7 – V9

Plot Size: 2 rows 35' x 30" 4 replications

Soil Type: Wyrick-Marbie

Cooperators: Phil Blevins and Johnny Robinson

¹ Trait Group according to Table 2.

² Days to maturity (DTM) provided by company; differences in maturity rating methods may exist.

³ Number of observations hybrid occurred (Obs); the greater the observations, the more reliable the data.

Shaded hybrids indicate hybrids entered in less than 3 locations. Hybrids are sorted by Brand then DTM.

Handy Bt Trait Table

CDD #028
Updated
April 2014

Chris DiFonzo, Michigan State University, East Lansing, MI
&
Eileen Cullen, University of Wisconsin, Madison, WI

The most up-to-date
version of this
bulletin is posted at:
www.msuent.com

Many corn hybrids contain multiple transgenic traits and seed costs are rising. Meanwhile, refuge requirements dramatically for multi-trait corn, generally dropping from 20% to 10% or 5%, depending on the trait package and company. Some traits still require a structured refuge planted as a block or series of rows, but many hybrids are now sold as refuge-in-the-bag (RIB). Purchasing the right trait package for your pest spectrum, and understanding its refuge requirement, is critical to maximizing profitability and delaying resistance. But this process may be confusing. The table on page 2 of this bulletin summarizes, to the best of our ability, currently available Bt traits, their spectrum of control, and refuge requirements. We make every attempt to provide up-to-date information for each Bt option. However, it is still important for you to take the following steps:

- *Understand the **terminology** used by your seed company;
- *Understand the **biology** of each trait, the expected level of control, and refuge requirements;
- ***Confirm that the seed you ordered the previous year** is the seed delivered to you in spring;
- *Keep good **planting records**;
- *For herbicide applications, **Ask Twice-Spray Once**, especially if you hire a custom applicator;
- *Save a representative sample of **bag tags** = the first thing to check if something goes wrong;
- *Most important, if you see **unexpected damage or poor performance** of a trait during the field season, contact your seed dealer immediately so that the field can be visited while the problem is still visible and fresh samples can be taken.

Abbreviations used in the Bt Trait Table

| <u>Herbicide traits</u> | |
|-------------------------|--|
| GT | glyphosate tolerant |
| LL | Liberty Link (glufosinate-tolerant) |
| RR2 | Roundup Ready 2 (glyphosate-tolerant) |

Insect targets

| | |
|-----|----------------------|
| BCW | black cutworm |
| CEW | corn earworm |
| ECB | European corn borer |
| FAW | fall armyworm |
| RW | corn rootworm |
| SB | stalk borer |
| WBC | western bean cutworm |

| Target or Activity | Protein(s) expressed | Event | Trade name |
|------------------------------------|-------------------------|-------------|-------------------|
| corn borer | Cry1Ab | MON 810 | YieldGard CB |

¹ Days to maturity provided by company; differences in maturity rating methods may exist between companies.

² Hybrids that were tested over more site/year combinations provide a better estimate of hybrid performance than those tested only in a single site/year location.

³ Relative Ton per Acre (yield) calculated by dividing Ton per Acre for each hybrid at each site/year by the average Ton per Acre for that site/year. Numbers over 100 indicate above-average yield, 100 indicates average yield, numbers under 100 indicate below-average yield.

* Indicates numbers similar to the highest value in that column (i.e. within one LSD of the top performer.)

Shading indicates hybrids that were in the highest yielding group in at least three site years.

¹ Days to maturity provided by company; differences in maturity rating methods may exist between companies.

² Hybrids that were tested over more site/year combinations provide a better estimate of hybrid performance than those tested only in a single site/year location.

³ Relative Milk per Acre (yield x quality) calculated by dividing Milk per Acre for each hybrid at each site/year by the average Milk per Acre for that site/year.

Numbers over 100 indicate above-average yield, 100 indicates average yield, numbers under 100 indicate below-average yield.

* Indicates numbers similar to the highest value in that column (i.e. within one LSD of the top performer.)

Shading indicates hybrids that were in the highest yielding group in at least three site years.
